

Footer Improvements for Option Trip

Please update the website footer to make it clearer, more professional, and closer to the structure used by leading travel platforms.

The footer should be organized into five columns.

1. About Option Trip

This column should contain:

- Option Trip logo
- Short description of the platform
- Contact email
- Contact page link

Example description:

Option Trip is an AI-powered travel planning platform that helps users create personalized trips using intelligent recommendations.

2. Company

- About Option Trip
- How It Works
- TravelBuddy (VI)
- Blog
- Contact Us

This section explains the platform and the technology behind it.

3. Travel

- Explore Destinations
- Trip Ideas
- Travel Map
- Popular Routes
- Travel Tips

This section helps users explore travel content and improves SEO.

4. Support

- Help Center
- Contact Support
- Travel Questions
- Feedback

This section will be used for customer support and user communication.

5. Legal

- Privacy Policy
- Terms of Service
- Cookie Policy
- Data Protection

Additional policies (such as refund policies) can be added later when payment systems are implemented.

Additional Elements

Please keep the following elements in the footer:

- Language selector
- Social media icons
- Copyright line

Example:

© 2026 Option Trip. All rights reserved.

Trust and Technology Block

To increase user trust, please add a small informational section in the footer.

Example text:

AI-powered travel planning
Personalized travel routes
Smart travel recommendations

Also add:

15	We need a feature that allows the user not only to speak to the AI through the microphone, but also to hear the AI's responses through audio. In other words, there should be a "Listen" or "Play audio" button so the user can hear what the AI is saying, not just read the text. Additionally, it would be ideal to support real-time voice interaction, similar to ChatGPT voice mode, where the user can talk to the AI and immediately hear its spoken responses.						
		InProgress					80%

Please start building the basic structure of the User Account area. This should become the main place where users manage their trips and interact with VI (TravelBuddy).

The account should remain simple and clean, but include the following sections.

1. Dashboard

The first page after login.

It should show:

- upcoming trips
- recent trips
- saved travel ideas
- recommendations from VI
- quick actions (continue trip planning, view map, ask VI)

This page should function as the main travel control center.

2. My Trips

This section should store all trips.

Trips should be organized into:

- Upcoming Trips
- Past Trips
- Draft Trips

Each trip page should contain:

- itinerary
- flights
- hotels
- transportation
- activities
- trip notes
- route map

3. My Travel Map

Each user should have a personal travel map.

The map should display:

- visited destinations
- planned trips
- wishlist destinations

Users should be able to:

- zoom in/out
- open trip details from map

markers

- manually add or edit places

Privacy settings should allow the user to:

- keep the map private
- share selected locations
- share routes with other users

4. Saved Ideas / Wishlist

Users should be able to save:

- destinations
- routes
- hotels
- experiences
- ideas suggested by VI

This section will help users plan future trips.

5. Road Comments / Travel Tips

Instead of a forum, users should be able to leave short comments connected to places.

Comments can be attached to:

- cities
- landmarks
- routes
- map points

These comments may include travel tips, warnings, or recommendations.

6. VI Assistant Center

Users should have a dedicated place to interact with VI (TravelBuddy).

Users should be able to:

- ask travel questions
- modify trips
- ask about flights and ticket changes

- request recommendations
- continue conversations with the assistant

Build OptionTrip Booking Core (Phase 1: Hotels, Flights, Rental Cars)

Priority:
High

Type:
Feature Development

Description:
We are starting Phase 1 of the OptionTrip booking system development.

The goal of this phase is to build the core booking architecture for three main product categories:

- Hotels
- Flights
- Rental Cars

This phase should focus on creating the basic booking structure and user flow that will later be used by the AI Travel Buddy system.

Even if external booking provider APIs are not yet connected, the system must be built integration-ready. Mock data can be used if necessary to simulate search results and booking steps.

The objective is to create a complete booking flow skeleton that will later support real integrations and payments.

Scope of Work

1. Create Unified Internal Data Models

Define internal data structures for the three booking categories.

Example fields:

Hotel

- id
- name
- location
- price
- currency
- rating
- photos
- amenities
- cancellation_policy
- availability

Flight

- id
- airline
- departure
- arrival
- duration
- baggage
- fare_type
- price
- currency
- refund_policy

Rental Car

- id
- company
- pickup_location
- dropoff_location
- car_type
- transmission
- fuel_policy
- seats
- price
- currency
- availability

These models will be used later to normalize data from external providers.

2. Create Search Forms

Build search forms for the following categories:

Hotels

- destination
- check-in date
- check-out date
- number of guests

Flights

- origin
- destination
- departure date
- return date
- number of passengers

Rental Cars

- pickup location
 - pickup date
 - return date
 - car category (optional)
-

	Create Integration Layer for External Booking Providers Priority: High Type: Backend Architecture Description: The OptionTrip platform will integrate multiple external booking providers (hotels, flights, car rentals). To support this, we need a dedicated integration layer that allows connecting supplier APIs without affecting the core platform architecture. The system should be designed so that different providers can be added or replaced easily. Scope of Work Create a provider integration structure that includes: • provider adapters • API connection logic • data transformation • response handling Each provider should connect through its own adapter. Example structure: Provider Adapter → Data Normalization → OptionTrip Internal Model This allows the platform to maintain a unified internal structure regardless of the supplier API format. Expected Outcome • modular provider integration architecture • ability to plug in hotel, flight, or car rental APIs • separation between external provider data and internal system logic				
41	Platform are ready to Integrate more providers				100%

Please start building the basic logic for VI (TravelBuddy) as the main AI assistant inside Option Trip.

The assistant should not behave like a simple chatbot.
It should function as a personal travel companion that helps users before, during, and after the trip.

1. VI Should Be Connected to the User Account

VI must have access to the user's account data, including:

- trips
- saved ideas
- personal travel map
- notes
- preferences
- previous conversations

This is necessary so the assistant can give personalized answers.

2. VI Should Remember the User

VI should have long-term memory and remember useful travel-related information about each user.

It should remember:

- preferred destinations
- travel style
- budget preferences
- trip duration
- favorite types of

accommodation

- liked and disliked places
- previous travel discussions

The goal is for VI to improve over time and give better recommendations.

3. VI Should Remember Each Trip Separately

Every trip should have its own structured memory.

For each trip, VI should know:

- itinerary
- flights
- ticket conditions
- hotels
- route details
- notes
- saved places
- previous AI suggestions

related to that trip

This will allow VI to answer practical questions such as:

- Can I change my return ticket?
- Is this flight refundable?
- Can I stay longer?
- What is the best route adjustment?

4. VI Should Use Real-Time Travel Context

During the trip, VI should also use live information such as:

- current location
- weather
- time of day
- nearby places
- route progress
- local travel tips and

comments

This allows the assistant to provide useful real-time travel advice.

5. VI Should Support Conversational Travel Help

Users should be able to talk to VI naturally, as they would with an intelligent assistant.

Examples:

- I want a warm beach trip in

May

- Can I stay two more days?
- Is my ticket refundable?
- Show me a quieter

alternative

- What should I visit nearby?

VI should answer clearly and use the user's account data and trip data when relevant.

88	Unified Trip Data Model (Central Trip Structure) Priority: High Type: Core Architecture						
	Description OptionTrip needs a central trip data model that connects all travel-related features into a single trip structure. Instead of storing flights, hotels, routes, notes, and map locations separately, all travel data should be connected to a Trip Object. This Trip Object will become the core element of the platform. All systems should reference the same trip: •booking system •TravelBuddy assistant •travel map •TripStory •live trip mode •user dashboard						
	Example Trip Structure Each trip should contain a structured data model such as: Trip •trip_id •user_id •destination •start_date •end_date •status Trip components: Flights Hotels Car rentals Route points Saved locations Travel notes TripStory entries Voice reviews						
	Trip Status System Each trip should have a status: planned active completed This will allow the system to activate features like Live Trip Mode automatically.						
	Why This Is Important Without a unified trip model, different parts of the platform may store travel information separately. This can cause: •duplicated data •broken integrations •difficulty connecting AI recommendations to trips A unified trip model will allow: •AI TravelBuddy to understand trips •the map to show routes •Live Trip Mode to work correctly •booking systems to attach reservations to trips						
	Expected Result After this ticket: •the platform has a central Trip Object •all travel data connects to that trip •the system can support planning, booking, and live travel assistance.						

90	Basic Payment Integration (Stripe / PayPal Ready) Priority: High Type: Core Platform Requirement Description OptionTrip should prepare the platform for payment processing. At this stage, the system does not need full booking provider integration, but it should support a basic payment-ready architecture. The platform should be able to: •connect Stripe or PayPal later •attach payment to a booking •store booking confirmation The payment system should be modular so external booking APIs can be connected later. Expected Result The booking flow should be able to support: Select product Enter traveler details Payment step (placeholder) Booking confirmation This ensures the platform is ready for real transactions.						0%
	Homepage Hero Section Needs Clear Product Positioning Description The current homepage hero section does not clearly communicate the unique concept of OptionTrip as a travel companion platform. Visitors should understand within a few seconds that OptionTrip is not just another travel search site, but a system that helps users discover, plan, and manage their trips in one place. Recommendation Replace the current hero text with a clearer positioning such as: Headline Not Just Travel. A Travel Companion. Subheadline Discover destinations, plan your journey, and travel with a digital companion that helps before, during, and after your trip.					Completed	100%

16	This feature is part of the OptionTrip Travel Map system. I would like to introduce an additional feature in the user account area related to the travel map and community interaction. As part of the personal account, users will have their own travel map where they can see the places they have visited, the routes they have taken, and possibly destinations they plan to visit in the future. This map should primarily remain a personal tool for tracking travel history and planning trips. However, I would like to extend this feature with an optional community component. Users should have the ability to decide whether their travel map or certain parts of it can be visible to other users of the platform. For example, they could choose to share their visited countries, cities, or routes publicly, or keep them completely private. Privacy settings should allow users to control what is visible: their full route, only destinations, or nothing at all. If a user decides to share parts of their travel map, other registered users could see those shared routes or locations on a community map. This would not function as a traditional forum, but rather as a map-based community layer where travel experiences are connected to specific places. Users should also be able to leave comments, tips, or short reviews attached to specific destinations, cities, or routes on the map. These comments would allow travelers to share their experiences, warnings, or recommendations with others. For example, they might mention that a location is very crowded at certain times, that a restaurant is excellent, or that a particular place may be temporarily closed or under renovation. In addition to user-generated comments within our platform, our TravelBuddy assistant should also build its recommendations based on reviews and feedback from multiple sources. Ideally, the AI system should analyze reviews from our own platform as well as publicly available reviews from sources such as Google, Booking, and TripAdvisor. The goal is not necessarily to display direct links to those reviews, but rather to allow the AI to learn from the overall sentiment and patterns within those comments. For example, if many travelers report that a certain attraction is overcrowded, temporarily closed, unsafe at night, or highly recommended, the AI should take this information into account. Our AI assistant should continuously learn from these reviews and comments to provide more accurate and helpful advice to travelers. For example, if a user is planning to visit a specific place, the system could warn them about common issues, suggest better times to visit, recommend alternatives nearby, or highlight particularly positive experiences reported by other travelers. This review-based intelligence should become one of the core components of the TravelBuddy system. The more comments, feedback, and travel experiences the system analyzes, the better recommendations it will be able to provide. Overall, the idea is to create a dynamic ecosystem where the personal travel map, community travel experiences, and AI-powered recommendations all work together to guide the traveler before, during, and after their trip.	InProgress			0%
----	---	------------	--	--	----

	This feature is part of the OptionTrip Travel Map system. One of the ideas of this website is to attract more people to work with us and to keep our clients engaged with the platform for a long time. To support this, it would be great if users could see a visual map of the routes and places they have already traveled to. Instead of just showing a list of trips or text records, we would like to create a Google Map inside the user account where their visited locations are displayed. Ideally, this map should be created automatically based on their trips, but users should also have the ability to edit it if needed. For example, if they have visited certain cities or places, those locations should appear as markers on the map. Users should be able to zoom in and out and clearly see where they have already been. Another idea could be highlighting the countries they have visited. Overall, this feature should be developed as a separate section inside the user account. The goal is for users to easily see where they have traveled and possibly where they would like to go next. Travel Buddy should help users build and manage this map, either automatically or with manual editing options. This is something we should begin developing as a new				0%
--	--	--	--	--	----

	This feature is part of the OptionTrip Travel Map system. I would like to introduce an additional feature in the user account area related to the travel map and community interaction. As part of the personal account, users will already have their own travel map where they can see the places they have visited, the routes they have taken, and possibly destinations they plan to visit in the future. This map should remain primarily a personal tool for tracking travel history and planning trips. However, I would like to extend this feature with an optional community component. Users should have the ability to decide whether their travel map or certain parts of it can be visible to other users of the platform. For example, they could choose to share their visited countries, cities, or routes publicly, or keep them completely private. Privacy settings should allow the user to control what is visible: their full route, only destinations, or nothing at all. If a user decides to share parts of their travel map, other registered users could see those shared routes or locations on a community map. This would not function as a traditional forum but rather as a map-based community layer where travel experiences are connected to specific places. Additionally, users could leave short location-based comments or tips attached to places or routes on the map. For example, someone visiting a city could see tips or notes left by other travelers who have been there before. These comments would be connected to destinations or routes rather than existing as a general discussion board. The idea is to build a system where the personal travel map can optionally become part of a larger community travel map. This would allow users to explore routes taken by others, discover tips related to specific destinations, and potentially see travelers who have visited or are planning to visit the same places. All of this should remain optional and controlled by the user through privacy settings inside their account. This feature should be implemented as an extension of the travel map system within the user account rather than as a separate forum or discussion platform.						
25	Inconsistent Language in Interface Description: After switching to Russian, the page shows mixed languages. Examples: Russian: - Начните Планировать Поездку Своей Мечты Сегодня English: - Best Tour Packages - Explore - Days Tours Expected Result: The entire UI should switch to one language consistently.						0%
31		Completed	100%				100%

79	Add "Why Choose OptionTrip" Section Description The homepage lacks a section explaining the advantages of using OptionTrip compared to other travel platforms. Recommendation Add a section highlighting key benefits such as: - personalized travel planning - integrated trip management - travel companion guidance - simplified trip organization.	Completed						100%

TripStory + Voice Travel Reviews on Travel Map

Priority
Medium

Type
Feature Development

Description

We want to introduce a new feature that allows users to easily share travel experiences connected to real locations on the Travel Map.

This feature combines three elements:

- Voice reviews (users can speak instead of typing)
- Location-based comments on the Travel Map
- External media links (photos or videos hosted on social platforms)

This feature will become the foundation for a concept called TripStory, where travelers share small travel experiences connected to places they visited.

The goal is to create a more interactive travel platform where users can leave insights, tips, and experiences directly on the map.

User Scenario

A traveler visits a destination and wants to share a short tip or experience.

Instead of typing a long text review, the user can click a button:

“Leave Voice Review”

The user records a short voice message describing their experience.

Example:

"This beach is beautiful in the morning but very crowded in the afternoon."

Voice Processing

The system should:

1. Record the voice message
2. Convert speech to text
3. Show the generated text to the user
4. Offer editing options

User options:

- Use original transcription
- Fix grammar
- Improve writing style

This allows users to create clear reviews without typing.

Travel Map Integration

Each review must be attached to a specific map location.

Locations can include:

- city
- landmark
- attraction
- route point

The review becomes a map comment visible when users explore the Travel Map.

Example:

Rome
“Best view of the city early morning.”

Santorini
“Sunset is better from this spot.”

This creates a dynamic layer of travel experiences connected to the map.

External Media Links (Important)

To reduce server storage and bandwidth costs, the platform will not host photos or videos directly at this stage.

Instead, users can paste links to media

Two-Stage Travel Planning Flow (Discovery Mode + Booking Mode)

Priority
Medium

Type
UX / Product Flow Improvement

Description

Currently the search system requires users to specify a country or destination before starting the search. This works for traditional travel booking systems but does not support our concept of AI-assisted travel discovery.

Many users do not know exactly where they want to travel. Instead, they only know the type of trip they want.

Example requests:

- Warm beach in May
- Romantic trip in Italy
- Quiet mountains in October
- Food trip in Spain

To support this behavior, we should introduce a two-stage travel planning flow.

Stage 1 – Discovery Mode

In this stage, the user can describe the type of trip they want without selecting a specific country.

Example input field:

“What kind of trip do you want?”

The user can type a request or ask TravelBuddy.

The system should then suggest:

- possible destinations
- countries
- example routes
- TripStory examples
- travel ideas

At this stage the system is helping the user discover destinations rather than search for specific bookings.

Stage 2 – Planning / Booking Mode

After the user selects a suggested destination, the system transitions into the normal search process.

At this point the standard booking fields appear:

- Country
- City / Destination
- Travel dates
- Number of guests
- Budget (optional)

Once these fields are filled, the platform can proceed with:

- hotel search
- flight search
- car rental search

This ensures the booking engine still receives structured location data while preserving the discovery experience.

UI Concept

The homepage search interface may include:

Field 1

“What kind of trip do you want?”

Field 2

Optional destination or country

Helper text example:

“You can describe your trip first and we will suggest destinations.”

Alternative Option

We may also provide two user paths:

1. I know where I want to go
(Traditional destination search)
2. Help me discover where to go
(AI TravelBuddy discovery mode)

Expected Outcome

This improvement will:

- support the AI TravelBuddy concept
- make trip planning easier for users who do not know their destination
- maintain compatibility with the technical requirements of the booking system
- improve the user experience

	Live Trip Mode (Travel Companion Mode) Priority: Medium Type: Feature Development Description: OptionTrip should support a Live Trip Mode that activates when a user's trip begins. The goal of this feature is to transform OptionTrip into a travel companion platform that assists users during their trip, not only during planning. When a trip becomes active, the system should switch the user interface into Live Trip Mode inside the user account and TravelBuddy system. This mode will provide real-time travel assistance based on the user's active trip. Main Features: When the trip is active, the system should display: •today's travel schedule •upcoming locations •route map •travel suggestions •quick actions to modify the trip •TravelBuddy assistance Example interface: Today in Rome Weather: 24°C Your plan today: Colosseum – 10:00 Lunch near Pantheon – 13:00 Sunset at Piazza Navona – 19:00 Expected Result: When a trip begins: •the system activates Live Trip Mode •the dashboard displays the active trip •TravelBuddy uses trip context •the map shows the active route The platform becomes useful during the trip, not only before booking.				
85	Trip Start Detection System Priority: Medium Type: Backend Logic Description: The platform should automatically detect when a user's trip begins. A trip can start in two ways: 1.Automatically when the trip start date equals the current date 2.Manually when the user presses Start Trip Once a trip starts, the system should mark the trip as Active. Trip Status Types: planned active completed When a trip becomes active: •Live Trip Mode becomes available •TravelBuddy receives the trip context •the user dashboard switches to trip view This will allow the platform to support travelers during the trip itself.				0%
86					

87	Live Trip Dashboard Priority: Medium Type: UX / Feature Development Description: When a trip becomes active, the user account dashboard should display a Live Trip section. This section should become the main control center for the traveler during the trip. Dashboard should include: •today's itinerary •travel map •upcoming activities •quick trip actions Quick Actions: Users should be able to quickly: •edit today's plan •ask TravelBuddy •add a travel note •leave a voice review •add a TripStory moment Map Integration: The map should show: •current route •planned destinations •nearby places •travel tips from other users						0%
	Destination Pages Structure Priority: Medium Type: SEO / Content Platform Description OptionTrip should support dedicated destination pages. Examples: Paris Rome Bali Tokyo Each destination page should include: •short destination description •travel tips •suggested routes •TripStory entries •map locations •related hotels and flights These pages will help: •SEO traffic •destination discovery •TravelBuddy recommendations Expected Result The platform should support URLs like: optiontrip.com/destination/paris optiontrip.com/destination/bali These pages can later integrate with: Travel Map TripStory AI recommendations.						0%

92	User Notifications System Priority: Medium Type: Platform Feature Description Users should receive important notifications related to their trips. Notifications may include: •trip starting soon •booking confirmation •travel suggestions •AI travel recommendations •TripStory interactions Notifications can appear: •inside the user dashboard •via email Example: "Your trip to Rome starts tomorrow." Expected Result The platform should support a basic notification system connected to user trips.						0%
	22	We should add an option that allows users to choose the color or theme of their screen. For example, they could select from several themes such as blue, black, green, red, yellow, orange, white, or light mode. In other words, users should have a few design options so they can customize the appearance of their personal page according to their preference.	This feature will take some time to implement, so we prefer to add it later in the next phase.				0%
	23	In the user account area, customers should have the ability to save their payment methods as well as their shipping address in case any delivery or shipment is required. Additionally, the account section should allow users to subscribe to our news updates and also unsubscribe from them whenever they wish.	In next Phase.				0%

	At the moment, the news section on the homepage looks good and matches the main website design. However, there is a UX and design inconsistency that needs to be fixed. Right now, when a user clicks on a news card from the homepage, the article preview appears within the main website style, but when the user clicks "Read More" or "Explore More," they are redirected to the separate WordPress blog. This breaks the design consistency and makes the user feel like they are leaving the main OptionTrip website. We would like to avoid this. What needs to be done The full news/article pages should open inside the main OptionTrip website design, not in the separate WordPress blog layout. In other words: - the homepage news cards should remain as they are now - when a user opens an article, the article should appear in the same design system as the main website - the user should not feel that they are being redirected to another platform Article page requirements Each article page should include: - the same main website header and footer - the same general design style as the main site - full article content displayed natively inside the main site - previous article / next article navigation - social sharing buttons - print option - comment section - ability to go back to the news list easily AI Image Generation for Articles For each news article, the system should automatically generate a featured image using AI based on the title or content of the article. This means that when a new article is created, the system should automatically generate an appropriate image without requiring manual image uploads. The goal is to simplify the content creation process so that images do not need to be added manually for each article. Future structure At this stage we can keep the news structure simple as it is now. Later we may introduce categories or thematic sections for articles, but this is not necessary at the moment. Main goal The blog/news system should feel like a natural part of the OptionTrip website, not like a separate WordPress blog. If possible, WordPress can remain only as a content management system in the background, while the article pages themselves should be displayed and rendered within the main OptionTrip front-end design so that the user experience stays consistent across the entire site.					
30	Duplicate Sections on Homepage Description: The homepage appears to repeat similar sections such as: - Best Tour Packages - Top Destinations The structure feels repetitive and may confuse users. Recommendation: Consider merging or reorganizing sections to avoid duplication.	Completed				100%
32		InProgress				0%

	Email Setup for Option Trip We need to create several professional email addresses using our domain optiontrip.com on the hosting provider. Please create the following email accounts: support@optiontrip.com info@optiontrip.com hello@optiontrip.com These addresses will be used on the website for support, contact pages, and general communication. Email Forwarding For now, we would like all emails from these addresses to be automatically forwarded to our Gmail inbox: OptionTripCom@gmail.com So please configure automatic forwarding for: support@optiontrip.com → OptionTripCom@gmail.com info@optiontrip.com → OptionTripCom@gmail.com hello@optiontrip.com → OptionTripCom@gmail.com This will allow us to manage all emails in one place while still using professional domain email addresses. Future Expansion For now, we only need these three email addresses. In the future, we may create additional domain emails as the platform grows. But at this stage, please set up these three emails with forwarding to Gmail.	Completed			100%
66	Add "How OptionTrip Works" Section on Homepage Description Currently the homepage does not clearly explain how the platform works. Users should quickly understand the main process of using OptionTrip. Recommendation Add a section explaining the flow: 1. Describe the trip you want 2. Discover matching destinations 3. Build your trip 4. Travel with guidance from the assistant This will help new users understand the product faster.				80%
67	ALL PICTURES THAT WE NEED NOW COULD BE CRESTED BY AI	Completed			100%

	Today, most travel platforms work in a very similar way. Booking.com mainly functions as a search engine where users look through countless hotel options, while Expedia operates more like a large catalog where travelers browse and compare flights, hotels, and packages. The responsibility for planning the trip still falls almost entirely on the user, who must spend time searching, filtering, comparing prices, reading reviews, and trying to understand which option is the best. However, the next stage of the travel industry is moving toward AI-driven travel planning. Instead of forcing travelers to manually search through hundreds of results, platforms will begin to guide users through the entire planning process with intelligent assistance. If OptionTrip builds its AI Travel Buddy correctly, the platform can become something fundamentally different from traditional travel websites. OptionTrip could evolve into one of the first true AI-driven travel platforms, where users no longer need to spend hours searching, comparing, and planning their trips. In this model, the traveler does not have to open multiple tabs, check different websites, or analyze dozens of options. Instead, the user simply writes a request such as: “Plan my trip.” From that moment, the system begins to work as an intelligent travel companion. It can suggest destinations, identify the best flights, recommend suitable hotels, offer rental cars if needed, and assemble complete travel options that match the traveler’s preferences, budget, and travel style. The traveler no longer needs to search manually, compare hundreds of listings, or spend hours organizing a trip. The planning process becomes faster, simpler, and much more intuitive. At the same time, the Travel Buddy is not just an AI machine or a basic chatbot. The idea is to create something closer to a real travel companion - a digital assistant that understands what the traveler wants and helps guide decisions rather than simply displaying search results. This approach allows OptionTrip to move beyond the traditional search-and-compare model and position itself at the forefront of the next generation of travel platforms, where intelligent assistance replaces complex manual planning and turns travel preparation into a seamless experience.						0%
78	Improve First-Time User Onboarding Description New users currently do not receive guidance when they first arrive on the platform. Recommendation Add a short onboarding experience for first-time visitors: Examples: What kind of trip do you want? Beach, adventure, culture, relaxation. This will make the experience more engaging.						0%
80							

81	Add Structured FAQ Section						
	Description Users may have questions about how the platform works. Recommendation Add a FAQ section covering topics like: • how trips are planned • how bookings work • how recommendations are generated • how user data is used.						0%

This feature is part of the OptionTrip Travel Map system. Travel Map Sharing Feature (Growth Feature)

Title:
Add Travel Map Sharing Feature for Users

Type:
Feature Development

Priority:
Medium

Description

As part of the user travel map system, we should allow users to share their personal travel map with others.

Currently, the travel map is designed as a personal tool where users can see places they have visited and destinations they plan to visit. This feature can become much more powerful if users can optionally share their travel map publicly.

The goal is to allow travelers to showcase their journeys and inspire others, while also helping the platform grow organically.

Feature Concept

Each user should have the option to generate a shareable version of their travel map.

This map may include:

- visited countries
- visited cities
- travel routes
- planned destinations

(optional)

Users should be able to control what is visible through privacy settings.

Privacy Settings

Users should be able to choose:

- Private map (only visible to the user)
- Share visited countries only
- Share full travel map
- Share selected routes or trips

Sharing Options

Users should be able to generate a shareable link for their map.

Example:

optiontrip.com/travel-map/username

Users can share this link on:

- social media
- blogs
- messaging apps.

Optional Future Feature

Allow users to export their travel map as a visual card or image such as:

"My Travel Map – 32 Countries Visited"

This could be shared on social platforms.

Expected Outcome

This feature will:

- increase user engagement
- encourage users to return to update their travel history
- create shareable travel content
- help attract new users through organic sharing.

85	Social Sharing System for Travel Map, TripStory, and Travel Content Priority Medium Type Feature Development / Growth Feature Description OptionTrip should be designed as a platform where users can easily share their travel experiences outside the website. Social sharing should be integrated as an important part of the product architecture. Users should be able to share travel-related content created on the platform with one click. Shareable content should include: - Personal Travel Map - TripStory pages - Travel routes - Destination pages - Location-based comments - Travel recommendations The purpose of this feature is to encourage users to share their travel experiences on social platforms and increase organic growth of the platform. Feature Requirements 1. Share buttons on key pages Add share functionality to the following pages: - Travel Map pages - TripStory pages - Travel routes - Destination pages - User travel profiles (future) 2. Supported platforms The sharing system should support: - Facebook - X / Twitter - WhatsApp - Telegram - LinkedIn - Copy link 3. Public shareable URLs When users share content, the platform should generate clean public URLs. Examples: optiontrip.com/travel-map/username optiontrip.com/tripstory/username/trip-name optiontrip.com/route/route-name 4. Privacy controls Users must be able to control which content is shareable. Possible settings: - private - share selected trip - share travel map - share visited countries 5. Social preview metadata All shared links must include metadata for social networks: - page title - description - preview image - Open Graph tags - Twitter/X card metadata This ensures that shared links display properly on social platforms. Expected Result Users can easily share travel experiences created on OptionTrip, increasing engagement and bringing new users to the platform through organic sharing.				0%

	Auto-Generated Travel Share Cards (TripStory & Travel Identity) Priority Medium Type Feature Development / Viral Growth Feature Description To encourage users to share their travel experiences on social media, the platform should be able to automatically generate visual travel cards based on user activity. These cards represent the user's travel identity and travel experiences in a visual format that can easily be shared. Examples of share cards: - My Travel Map – 18 Countries Visited - Italy TripStory – May 2026 - Rome → Florence → Venice Travel Route - My Favorite Beaches in Greece - My Top 5 Places in California These cards should be automatically generated using user data from the platform. Card Content Each card may include: - title - route or destination name - small map preview - trip summary - number of countries visited - OptionTrip branding These cards should be optimized for social sharing formats. Share Formats Cards should be designed to work well on: - Instagram posts - Instagram stories - X / Twitter - Facebook - LinkedIn Users should be able to download or share the card directly. User Flow Example: User completes a trip or adds locations to their Travel Map. The system automatically generates a visual card such as: "My Travel Map – 12 Countries Visited" The user is then prompted: "Share your travel map with friends." Future Expansion Possible future features: - animated cards - seasonal travel cards - yearly travel summary - travel achievements or milestones Expected Result These visual cards will encourage users to share their travel experiences, bringing new users to the platform through social media and helping OptionTrip grow organically.				0%

	Travel Achievements and Travel Levels System Priority Low–Medium (Growth / Engagement Feature) Type Feature Development Description To increase user engagement and encourage users to continue exploring and sharing their travel experiences, we want to introduce a Travel Achievements and Travel Levels system. This feature will reward users for their travel activity on the platform. Achievements should be automatically generated based on user activity such as: - countries visited - cities visited - travel routes created - TripStories created - map contributions - travel tips or reviews shared The purpose of this feature is to make the platform more engaging and motivate users to continue using OptionTrip. Feature Concept Each user profile can include a section called: Travel Achievements Examples of achievements: - First Trip Added - 5 Countries Visited - 10 Cities Explored - First TripStory Created - First Travel Route Created - 10 Travel Tips Shared Achievements should be automatically unlocked when users reach certain milestones. Travel Levels In addition to achievements, users can have travel levels such as: Level 1 – Explorer Level 2 – Traveler Level 3 – Adventurer Level 4 – Pathfinder Level 5 – Global Traveler Levels can be calculated based on total travel activity. Example criteria: - number of locations added - number of trips created - number of countries visited - number of map contributions Profile Integration Achievements and travel level should appear on the user profile page. Example: Username Travel Level: Explorer Countries Visited: 8 Cities Added: 24 Trips Created: 3 Social Sharing Achievements should be shareable. Example share cards: - “I visited 15 countries on OptionTrip” - “My first TripStory is live” - “Explorer Level unlocked” These cards should be compatible with social media sharing. Future Expansion (optional) Possible future upgrades: - yearly travel summaries - travel badges - regional achievements - community rankings Expected Outcome This feature will increase user engagement and encourage users to:

88	Yearly Travel Report (Personal Travel Summary)						
	Priority Medium						
	Type Feature Development / User Engagement						
	Description						
	We want to introduce a feature called Yearly Travel Report that automatically generates a summary of a user's travel activity during the year.						
	This report should visualize the user's travel data in a clear and engaging format.						
	The goal is to help users reflect on their travel experiences and encourage them to share their travel summary with friends.						
	Feature Concept						
	At the end of each year, the system automatically generates a personal travel summary.						
	Example: "Your 2026 Travel Summary" The report may include: - number of countries visited - number of cities visited - number of routes traveled - number of TripStories created - most visited country - longest trip - favorite destination Visual Elements The report should include: - a world map with visited countries highlighted - route maps of trips - small statistics cards - travel achievements earned during the year Social Sharing Users should be able to share their travel report. Example share cards: - "My 2026 Travel Map" - "12 Countries Visited in 2026" - "My Favorite Destinations of the Year" Expected Result This feature will encourage users to: - review their travel activity - return to the platform regularly - share their travel summary on social media - continue building their travel history on OptionTrip.

89	This feature is part of the OptionTrip Travel Map system. User Public Travel Map Pages Priority Medium Type Feature Development / SEO Growth Description Each user should be able to have a public page displaying their personal Travel Map. This page represents the user's travel history and travel identity. Example URL: optiontrip.com/travel-map/username Page Content The page should display: - world map with visited countries - cities added by the user - routes created by the user - TripStories created - travel achievements Example layout: Username Countries Visited: 14 Cities Added: 38 Trips Created: 6 Interactive Travel Map The page should include an interactive map showing: - visited countries - cities - travel routes Social Sharing Users should be able to share their travel map. Example share messages: "My Travel Map on OptionTrip" Privacy Settings Users should be able to choose: - private map - public map - share selected trips only SEO Benefits Public travel map pages will create new indexed pages for the platform and allow search engines to discover travel content generated by users. Expected Result This feature will: - increase user engagement - encourage users to add more travel data - create shareable travel identities - increase organic growth and SEO traffic.

This feature is part of the OptionTrip Travel Map system. Visited Countries Map (Personal Travel Map Feature)

Priority
Medium

Type
Feature Development / User Engagement

Description

We want to introduce a feature called Visited Countries Map, which allows users to visually display the countries they have visited.

This feature helps users create a personal travel identity and encourages them to interact with the platform.

The map should visually highlight countries that the user has visited and show their travel progress around the world.

Feature Concept

Each user account should include a Personal Travel Map.

Users should be able to:

- mark countries they have visited
- update their visited countries list
- see their travel progress visually on a world map

Example display:

Countries visited: 18

A world map should highlight all visited countries.

User Flow

When a user registers or visits their profile for the first time, they should see a prompt:

"Create your travel map"

Users can then select countries they have visited.

Selection methods may include:

- clicking countries on the world map
- selecting countries from a searchable list

Map Visualization

Visited countries should be highlighted on the world map.

The map should update dynamically when users add or remove countries.

Example display:

Visited countries highlighted in color
Unvisited countries remain neutral.

Profile Integration

The user profile page should show:

- number of countries visited
- world map visualization
- link to the user's travel map page

Example:

Username
Countries visited: 18
Cities added: 34
Trips created: 5

Social Sharing

Users should be able to share their travel map.

Example share message:

"My Travel Map on OptionTrip – 18 Countries Visited"

Example public link:

optiontrip.com/travel-map/username

Privacy Settings

Users should be able to choose:

- private map
- public map
- share only selected trips

Future Expansion (not required now)

Possible future improvements:

93	Add Trust Micro-Block Under Main Search Section Description: Add a small trust and technology block under the main search area on the homepage. The purpose of this section is to quickly communicate that OptionTrip is a modern travel planning platform built with advanced technology. Suggested text example: Smarter way to plan your trip Powered by advanced travel technology • Personalized travel planning • Smart destination discovery • Intelligent travel recommendations This section should be visually simple and clean. It can be placed directly under the main search interface on the homepage. The goal is to increase user trust and clearly explain that OptionTrip is not just a traditional travel search website.						100%
	Add "Save Trip Idea" Button for Travel Suggestions Description: Users should be able to easily save travel ideas suggested by TravelBuddy or displayed on the platform. Add a simple button such as: Save Trip Idea or Save This Idea When the user clicks the button, the travel idea should be saved in the user account under a section such as: Saved Ideas or Wishlist Examples of content that users should be able to save: • suggested destinations • travel routes • trip ideas generated by TravelBuddy • interesting locations This will allow users to collect travel ideas and return to them later when planning their trips. The goal is to increase engagement and encourage users to continue exploring travel ideas on the platform.						0%

	Add Trust / Social Proof Section on Homepage Description: Add a small trust section on the homepage that helps visitors quickly understand that OptionTrip is a modern travel planning platform. This section should appear below the main search or below the hero section. The section may include a short headline such as: Plan Your Trips Smarter And a short description: OptionTrip helps travelers discover destinations, organize trips, and explore the world using advanced travel technology. Below this text, show several small elements that build trust. Examples: • Smart travel planning • Personalized trip suggestions • Discover destinations faster • All your trips in one place Optional future elements (not required now): • number of destinations available • number of travel routes • number of trips created by users The design should remain simple and clean. The goal of this section is to quickly build trust and explain the value of the platform in the first seconds when a visitor arrives on the website.					
	95	Completed				100%
	4	remove "About Us" in bottom its enough	Completed			100%
	Currency selection There should be a currency selection button on the website. The system should automatically display the currency based on the user's location. For example, if the user is in Brazil, the currency should be Brazilian Real; if the user is in the United States, it should be US dollars; and if the user is in Russia, it should automatically show rubles. At the same time, the user should have the option to manually change the currency if needed. This control could be placed at the bottom of the website, in the same area where the language selection is located. It may also be useful to add a country selection button, because the system determines the user's location via geolocation, but the user should still have the option to choose their country manually if necessary. Ideally, there should be three controls at the bottom of the page: 1. Currency selection 2. Language selection 3. Country selection This will help the system understand the user's location and display the most convenient currency and settings for them.					
	5	Completed				100%

	Please make the following adjustments on the homepage. 1. Main Button Replace the search button with: “Show My Option Trip” This should be the main action button. _____ 2. Destination Field Add a small question mark icon (?) next to Destination. When the user hovers over it, show this tooltip: “Users can enter a country, city, region, landmark, or continent. Examples: Italy, Paris, Mediterranean, Alps, Bali.” _____ 3. Dates Field Add a question mark icon (?) next to Dates. Tooltip text: “You can choose exact travel dates or select a general period such as a specific month.” _____ 4. Trip Type Field Add a question mark icon (?) next to Trip Type. Tooltip text: “Trip type describes the style of travel. Examples: vacation, honeymoon, cruise, hiking trip, adventure travel, beach holiday, family trip, city break.” _____ 5. TravelBuddy Examples Under the field “What you love and where you want to go”, add clickable examples: Warm beach in May Romantic honeymoon in Italy 5-day food trip in Spain Mountain hiking in Switzerland Hidden islands in Greece When a user clicks one of these, the text should automatically appear in the input field.					
6	Language Switching Issue (Russian Not Applied Everywhere) Description: When switching the website language to Russian, not all sections of the interface are translated. Some elements remain in English, creating an inconsistent experience. Examples: • Top Deals • The Last Minute Deals • Best Tour Packages • Explore button • 2 Guests • Days Tours • section descriptions Expected Result: All interface elements should change language consistently when Russian is selected.	Completed				100%
7		Completed				100%

8	Incorrect English Grammar in Main Headline Description: The main headline currently says: “Explore All Tour Of The World With Us.” This is grammatically incorrect. Suggested Fix: Use one of the following: • Explore Tours Around the World With Us • Explore the World With Us Impact: The homepage headline is the first thing users see. Incorrect grammar reduces trust in the platform.	Completed					100%
9	Incorrect Tour Duration Wording Description: Tour cards currently display text like: “6 Days Tours” “7 Days Tours” This is incorrect English. Suggested Fix: • 6-Day Tour • 7-Day Tour or • Duration: 6 Days	Completed					100%
10	Placeholder Text Not Localized Description: Some input placeholders remain in English after switching language. Examples: • e.g. Paris, France • e.g. Family Vacation • e.g. adults, children Expected Result: Placeholders should be translated depending on the selected language.	Completed					100%
11	Mixed Typography and Capitalization Description: Some titles use inconsistent capitalization such as: • Best Tour Packages • Explore All Tour Of The World With Us Capitalization rules should follow standard English title formatting. Recommendation: Use consistent headline style across the site.	Completed					100%
12	Tour Cards Layout Optimization Description: Tour cards contain multiple elements: • destination • price • rating • duration • description Some cards appear visually overloaded. Recommendation: Improve readability by: • reducing text length • balancing spacing • improving hierarchy of information.	Completed					100%

	Search Form UX Improvement Description: The main travel search form contains fields: • Destination • Dates • Trip type • Guests • Budget However, it is not very clear what the next step is for the user. Recommendation: Improve UX by: • making the Explore/Search button more prominent • adding hints or suggestions • enabling destination autocomplete.
